Weber (Danis-Weber) Classification

Lateral malleolus (fibula) fractures · level of the fracture relative to the syndesmosis

A **Below the syndesmosis** (infrasyndesmal, stable)

B **At the level of the syndesmosis**

C **Above the syndesmosis** (suprasyndesmal, unstable)

Type A	Type B	Type C
Usually stable: conservative treatment	Intermediate: depends on stability	Syndesmosis injured, unstable: usually surgery

The higher the fibular fracture line, the more unstable the ankle
